BITS DataVault

Data Sovereignty Infrastructure for Tokenized Asset Ecosystems

Blockchain Integrative Technology Solutions
contact@bitscorp.us
bitscorp.us
Richmond, Virginia

THE INFRASTRUCTURE GAP

The RWA tokenization market is projected to reach **$400B by end of 2026** — but the industry has built the on-chain compliance layer without building the off-chain data sovereignty layer underneath it. Investor PII, fund documents, compliance records, and operational data require a privacy-preserving custody solution that keeps sensitive information sovereign while providing cryptographic proof of integrity to on-chain systems. **That layer doesn't exist yet.**

WHAT DATAVAULT DOES

🔒 Privacy-First Architecture

Sensitive data never touches the blockchain. Only cryptographic hashes cross the network boundary — preserving complete document confidentiality while establishing immutable proof of existence and integrity.

📊 Operational Record Activation

Transforms dormant business records into searchable, authenticated, and economically active digital assets through AI-powered indexing and blockchain verification.

⚡ Smart Contract Automation

Embedded partnership terms auto-execute upon verified events — no manual intervention, no escrow, no renegotiation. Programmable ownership rights built in from day one.

🌐 Multi-Ledger Compatible

Blockchain-agnostic by design. Integrates with public chains, private networks, and permissioned ledgers — meeting institutional clients wherever their assets live.

VALUE TO TOKENIZATION PLATFORMS & THEIR CLIENTS

CURRENT GAP	WHAT DATAVAULT DELIVERS
Off-chain data custody undefined	Privacy-preserving data layer where investor PII, KYC records, and fund documents live — sovereign, encrypted, and cryptographically linked to on-chain assets
No new asset class creation	Expands addressable market by activating dormant operational records as tokenized assets — creating value from data that currently sits unused

CURRENT GAP	WHAT DATAVAULT DELIVERS
Manual partnership execution	Automated smart contract distribution on verified liquidity events — reducing legal overhead and accelerating deal velocity
Limited data monetization	Anonymized, aggregated data licensing with automatic revenue distribution — new recurring revenue stream for platform clients
Single-source oracle limitations	Cryptographic verification layer with Merkle-tree integrity proofs — strengthening trust for non-financial asset data feeds

PARTNERSHIP MODELS

01

TECHNOLOGY INTEGRATION

DataVault integrates directly into existing issuance protocols as the off-chain data custody and sovereignty layer

02

WHITE-LABEL DATA LAYER

Recommended solution for institutional clients requiring GDPR/CCPA-compliant data management under tokenized funds

03

JOINT PILOT

Deploy with a mutual institutional client to demonstrate combined on-chain compliance + off-chain sovereignty

KEY DIFFERENTIATORS

< $2K
Deployable edge hardware cost

4 hrs
From setup to operational

0 bytes
Sensitive data on-chain

100%
Client data sovereignty

PATENT PENDING — U.S. PROVISIONAL APPLICATION FILED 2026

BITS DataVault represents proprietary technology protected by pending U.S. patent applications covering the integrated pipeline of document activation, blockchain authentication, tokenized asset creation, and automated smart contract execution. We welcome partnership conversations with platforms building the future of tokenized finance.
